

What Limits Use of Fire as a Management Tool on National Forests?

Perspectives of Forest Service Line Officers

▀ Senior Leader Program Team Members

National Priority 4: Improving the condition of forests and
grasslands

Addressing Internal Barriers to the Use of Large Scale Fire
for Forest Restoration

Sarah McCaffrey, Rocky Mountain Research Station

Top Two Limiting Factors....

Prescribed Fire (Rx)

➤ 3 Most often mentioned factors

1. Burn window

2. Implementation resources

➤ Almost 20% these were the two main barriers :
"Small burn windows Lack of personnel on burn day".

3. Planning resources(NEPA and burn plans)

➤ \$ To hire specialists or demands to work on other priorities (timber)

"Lack of shelf stock and not enough resource specialists".

Top Two Limiting Factors....

Prescribed Fire (Rx)

- Mentioned by less than 20% of respondents
 - smoke issues
 - social license
 - internal concerns (generally risk aversion, suppression culture)
 - other larger scale priorities/considerations (mainly timber and WUI)

Top Two Limiting Factors....

Large scale Rx-

Similar to Rx with a few shifts. Topics that come up more often compared to Rx:

- Increased complexity creating a limiting factor:
 - Duration– uncertainty of resource availability, smoke concerns, impacts on accomplishing work on other priorities.
 - Larger scale–availability of personnel with skills for larger burns and of helicopters,
- Consideration of other land use issues/impacts (grazing, inholdings, checkerboard, ESA).

Top Two Limiting Factors....

Wildland Resource Benefit

- Resource availability dominant barrier - most statements making reference to PL 4/5.
- Internal concerns more commonly raised, particularly re support for WRB

- culture (both in terms of suppression and specialists),
- risk management/aversion, and
- lack of incentives.

*Culture...culture...culture! Internal resistance from specialists.
A quiet reluctance to assume risk from line.*

- Social (public, industry) acceptance raised more often than for Rx.

Initial Takeaways

Cross Cutting Themes

1) Clear desire for supportive consistent leadership = being told to burn more but...

- ▶ Not provided resources to accomplish
- ▶ Support varies depending on fire season (within and between)
- ▶ Lack of confidence that will have support if something goes wrong.

"I believe that our agency needs to make Rx burning a priority and issue direction to that effect. The agency needs to take ownership of this and provide direction and training to our employees. That's when things will change."

Initial Takeaways

- 2) Desire for creation of “**larger scale prescribed burn organization**”
 - Larger scale means similar mechanisms as with suppression
 - Share resources
 - Logistics
 - Hazard pay
- 3) Importance of **partnerships**
 - Key for any larger scale burning
 - Facilitates communication
 - Creates capacity and flexibility needed for larger burns

Beware the 'imagined public'

Overall findings do not support many of the Conventional Wisdoms or Narratives about public response to fire management

- Sampling bias
- Confirmation bias

False Narrative #1 –

Individuals don't understand the high fire risk

Reality – Vast majority of people know they live in high fire risk areas

- **Decision to take protective action (defensible space, evacuation) also depends on other factors**
 - Risk tolerance/aversion
 - Trade-offs with benefits (nature, privacy, etc.)
 - Self-efficacy (time, \$, etc.)
 - Response efficacy

False Narrative #2

“Smokey has taught the public to think all fire is bad”

Reality – Consistent evidence that:

- Individuals in fire prone areas have a good (often quite sophisticated) understanding of fire ecology, including beneficial role of fire.
- 80% see prescribed fire and thinning as an appropriate management tool
 - Roughly 30% give strong approval and another 50% give qualified approval
 - Clear preference for active forest management

False Narrative #3 –

People don't take responsibility

Reality - Strong sense of shared responsibility

- **People recognize their responsibilities** – expect to reduce risk on own property
 - Generally ~ 2/3+ have undertaken some type of mitigation
 - Recognize that risk is shared – concerned about actions on adjacent properties – particularly public lands
- **Expectations of government agencies** (local, fed, etc.)
 - Take care of their land
 - Education: Help understanding risk (fire behavior) and specifics on how to mitigate
 - Maybe help with some larger scale obstacles (disposing of materials)

False Demographic Narratives

No consistent evidence that:

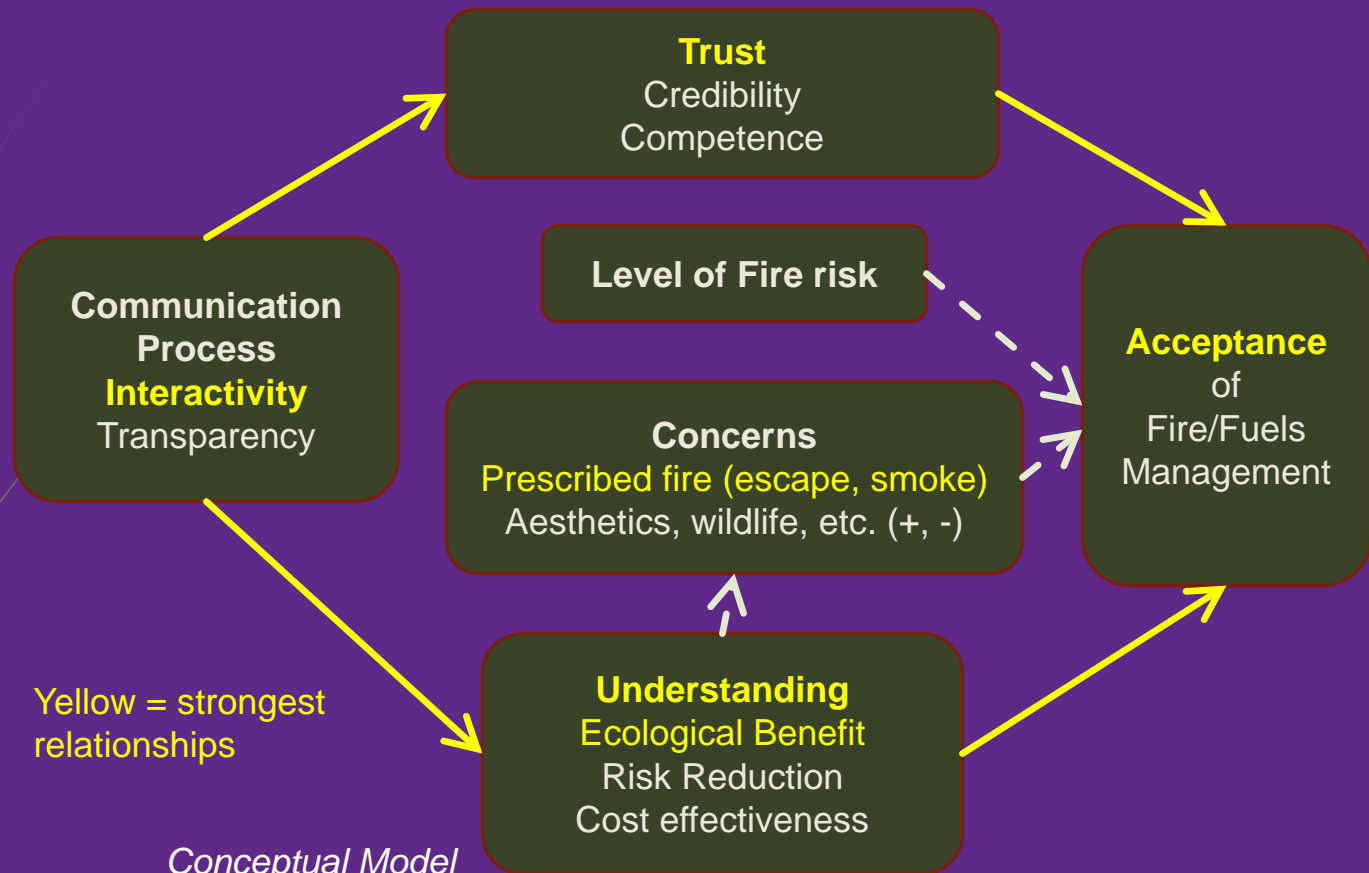

- *New residents* are less aware and/or active in relation to fire mitigation
- *Part-time residents* are less likely to understand fire risk than full-time residents (*main issue appears to be time*)
- *Experience* with fire will have a consistent effect
- *Basic demographic* characteristics (gender, income, education, etc.) have a meaningful effect.
- There are meaningful *regional* differences

Actual Influential Dynamics

- **Knowledge:** Better understanding of a practice is associated with higher acceptance/action
 - **Ecological benefits of a practice particularly important**
 - Concern about negative outcomes (smoke, escape) can influence.....but decrease with increased knowledge of ecological benefits
- **Trust:** Trust in information provider or treatment implementer predicts acceptance
- **Interactive /Shared information exchange** is associated with behavior change

Fire/Fuels Management Public Acceptance Model

(Thinning, Prescribed Fire, WFU)

Yellow = strongest relationships
